

This is an example for the new indent feature. Let's do some empty space indentation:

Here we go indented.

The Indentation holds for the rest of the paragraph, or...  
any new indent comes.

New paragraph, now indentation is gone. But we can indent with a label also:

**This is some label** Here we go indented.

And again, the Indentation holds for the rest of the paragraph, or any new indent comes.

Labels can be aligned:

**Left** Indent with label aligned to the left.

**Center** Indent with label aligned to the center.

**Right** Indent with label aligned to the right.

So, what can you do with that? How about lists:

- This is a list item
- Another list item
  - » Sub list item
- And yet another one

Also available with indents: Enumerators:

**I.** First item

**II.** Second item

**a)** A sub item

**b)** Another sub item

**III.** Third item

The following types are built in:

**1** ArabicEnumerator

**I** RomanEnumerator

**i** LowerCaseRomanEnumerator

**A** AlphabeticEnumerator

**a** LowerCaseAlphabeticEnumerator

For your convenience, you can do all that much easier with markup, e.g. simple indentation

At vero eos et accusam

And end the indentation. Now a list:

- This is a list item
- Another list item
  - » A sub list item
- And yet another one

Even enumeration is supported:

1. This is a list item

2. Another list item

a) A sub list item

3. And yet another one

And you can customize it:

I -> This is a list item

II -> Another list item

a ~ A sub list item

III -> And yet another one
